Etapas del proceso de experimentación (1)

- 1. Fijar por escrito el objetivo principal y los secundarios
- 2. ESCRIBIR lo que se conoce hasta el momento. ("Eso yo ya lo sabía")
- 3. Escoger cuidadosamente las variables (brainstorming, ...)
- 4. Escoger los niveles de las variables (mala selección ≅ fracaso)
- 5. Escoger la respuesta (respuestas de interés)
- 6. ¿Cómo se medirán los factores y las respuestas?: Calibración, viabilidad ...

Estadística Industrial

60

Etapas del proceso de experimentación (2)

- 7. El equipo elige el diseño más adecuado. Experto expone pros y contras (replantearse el número de variables ...)
- 8. Cuidar los detalles de la preparación (plantillas, códigos, probetas,...)
- 9. Planificar con detalle la realización de los experimentos (equipos de medida no disponibles, accesos cerrados los sábados, ...)
- 10. Controlar la realización del experimento (estar encima)
- 11. Analizar e interpretar los resultados
- 12. ¿Se han alcanzado los objetivos? ¿queda presupuesto? (No+Si = seguir)
